Assignment - I

1. What do you understand by asymptotic notation. Define different Asymptotic notation with example.

→ Asymptotic notations are the mathematical notations used to describe the running time of an algo when the i/p tends towards a particular value or a limiting value.

→ There are mainly 3 Asymptotic notations:-

(i) Big- σ notation

- It represents the upper bound of running time of an algo.
- This notation is called as upper bound of the algo., or a worst case of an algo.
- $\sigma(Cg(n)) = \{f(n)\}$: There exist positive constants c and n_0 such that $0 \leq f(n) \leq cg(n)$ for all $n > n_0$, where $c > 0$ and $n \geq n_0$.
- e.g.,

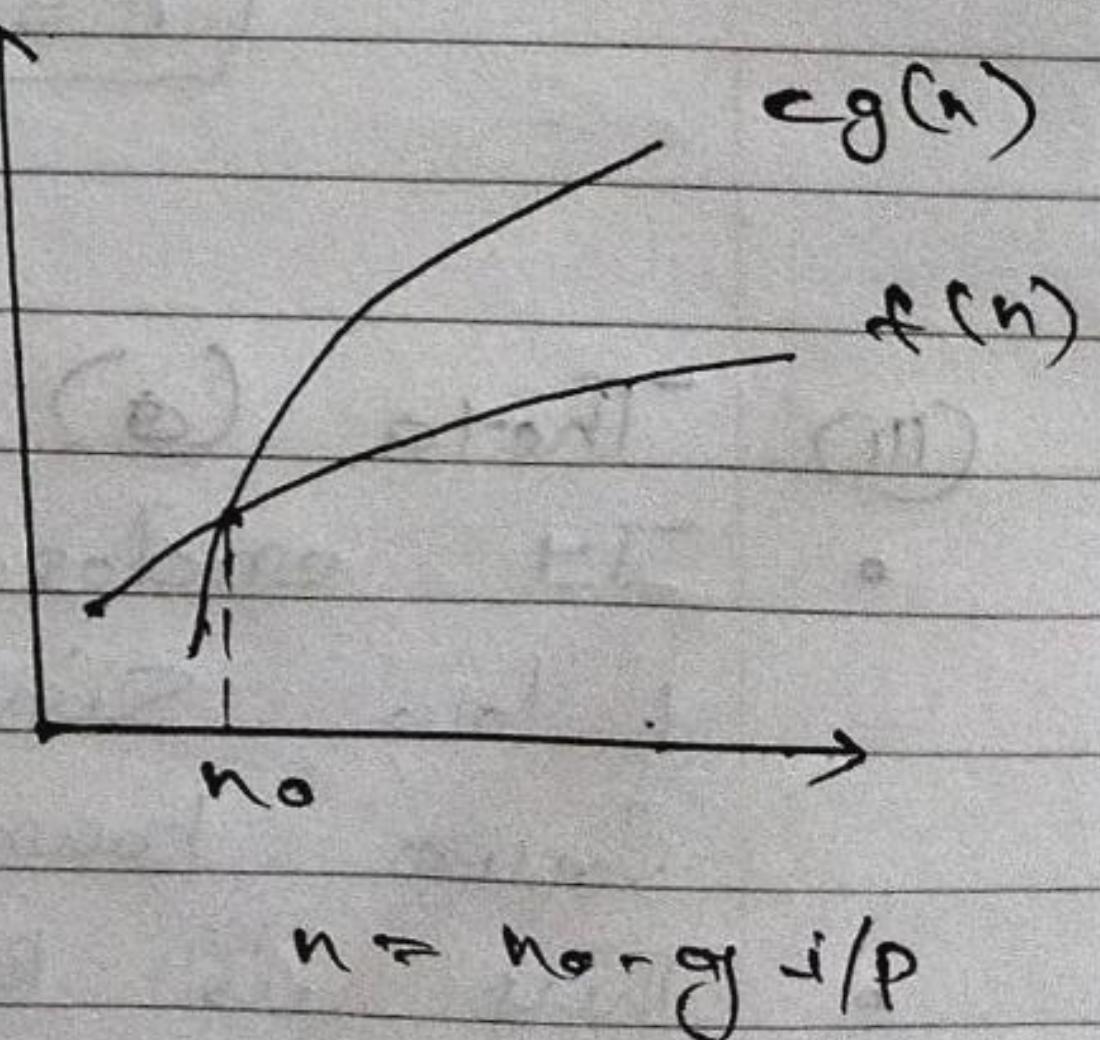

$$f(n) = 3 \log n + 100$$

$$g(n) = \log n$$

$$3 \log n + 100 \leq c \times \log(n)$$

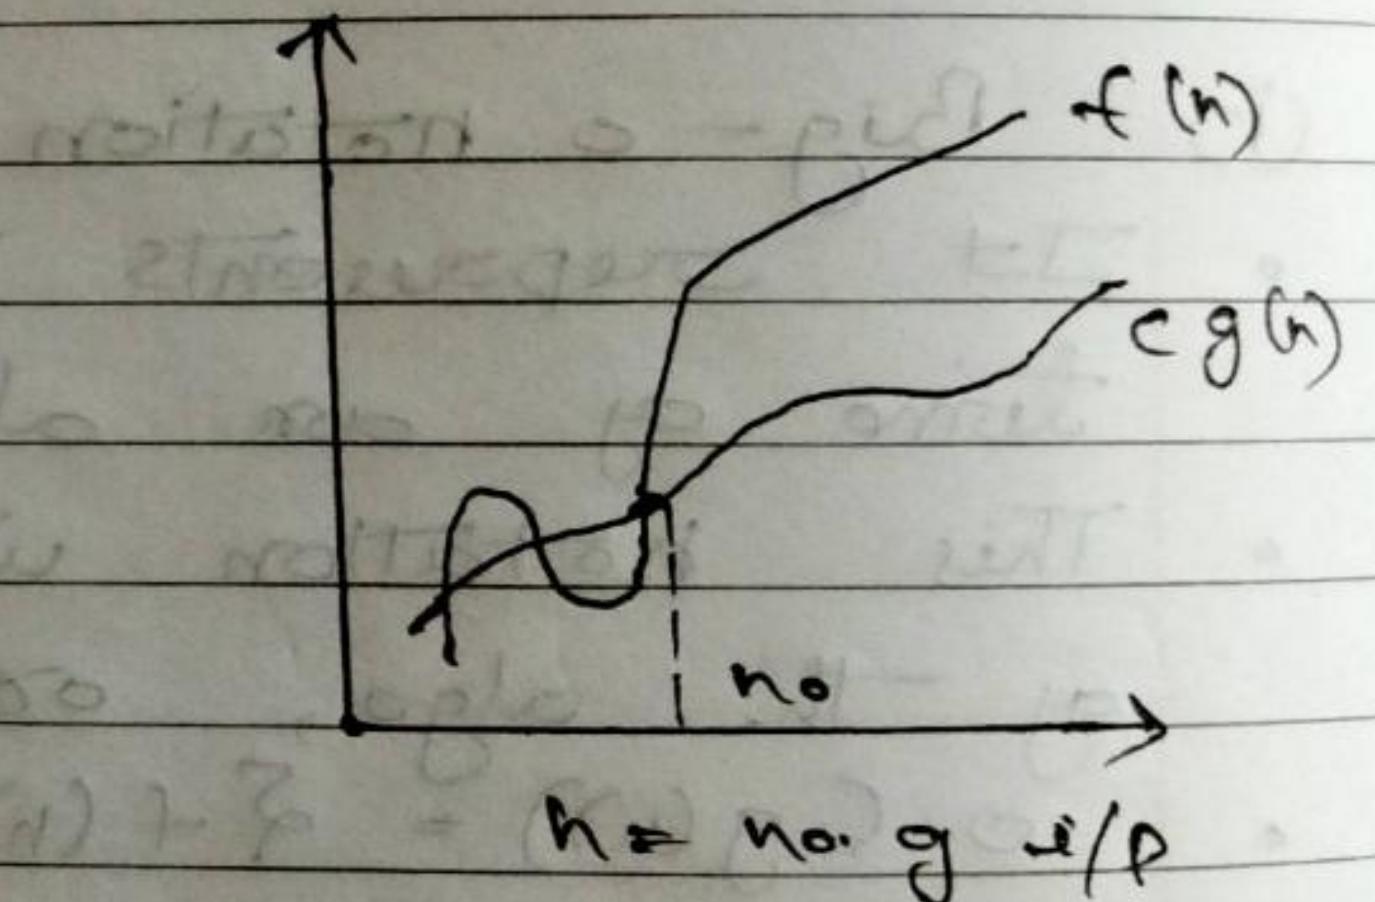

$$c = 150 \text{ and } n > 2$$

(c undefined at $n=1$)

(ii) Big Omega (Ω) Notation

- It represents the lower bound of the running time of an algo.
- This notation is known as lower bound of an algo, or best case of an algo.
- $\Omega(g(n)) = \{f(n) : \text{There exist positive constant } c \text{ and } n_0 \text{ such that } 0 \leq cg(n) \leq f(n) \text{ for } n > n_0\}$
- e.g.,
 $f(n) = 3n + 2$
 $c \cdot g(n) \leq f(n)$
 $[c = \text{constant}, g(n) = n]$
 $cn \leq 3n + 2$
 $cn - 3n \leq 2$
 $n(c-3) \leq 2 \Rightarrow n \leq \frac{2}{c-3}$

if we assume $c = 4$, then $n_0 = 2$

$$c = 4, n_0 = 2$$

(iii) Theta (Θ) notation.

- It enclose the function from above and below. Since, it represents the upper and lower bound of running time of an algo.
- This is known as tight bounds of an algo, or an average case of algo.

- $\Theta(g(n)) = \{f(n)\}$: There exist positive constant c_1, c_2 and n_0 such that

$$c_1 * g(n) \leq f(n) \leq c_2 * g(n) \quad n > n_0.$$

- e.g,

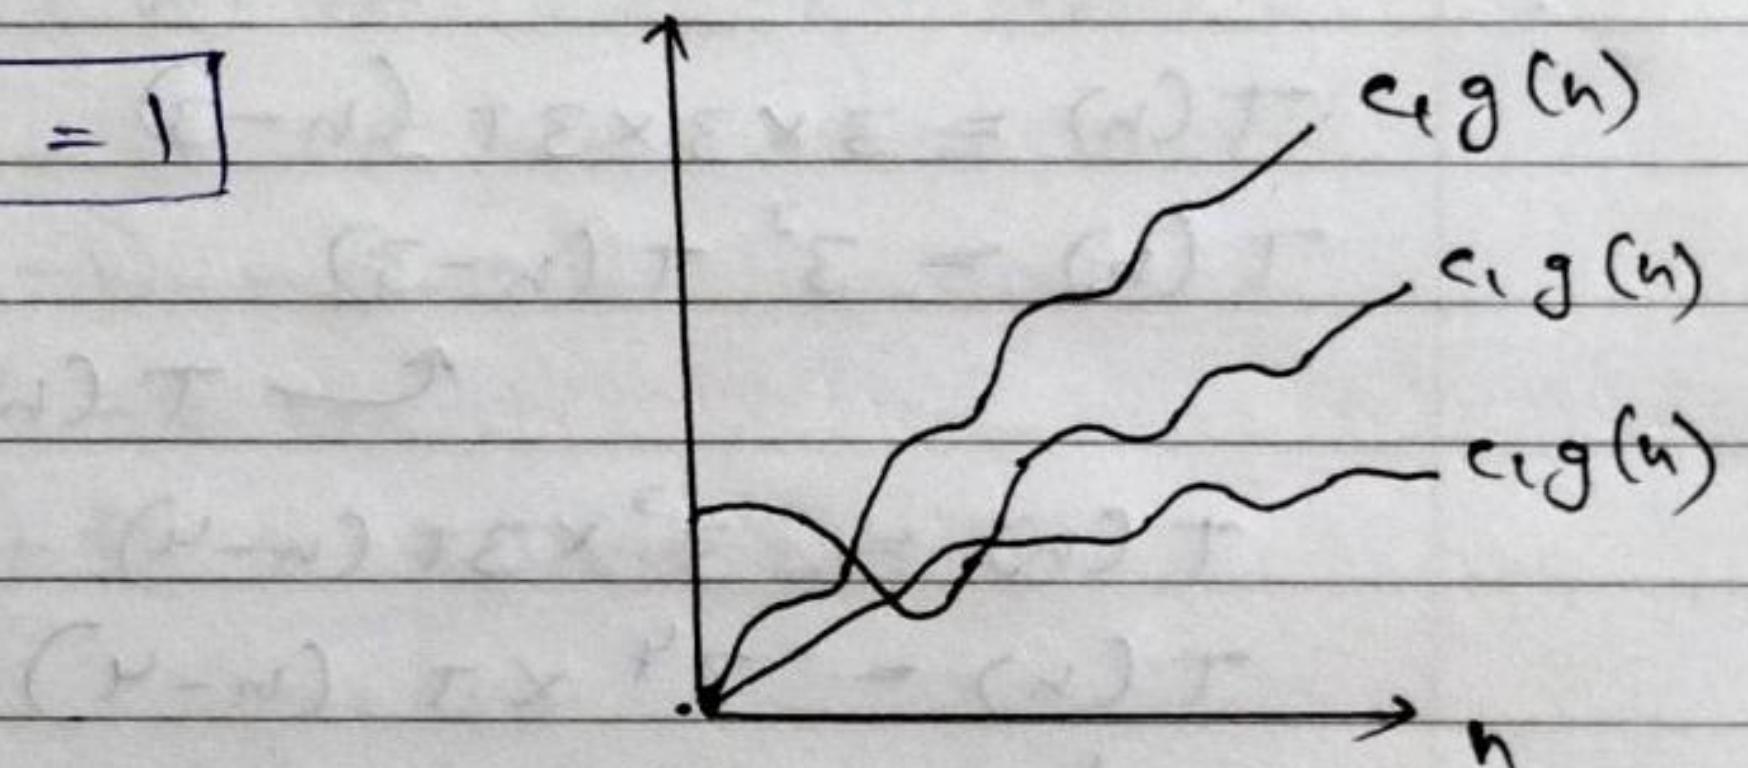

$$f(n) = 5n^3 + 16n^2 + 3n + 8$$

$$5n^3 \leq 5n^3 + 16n^2 + 3n + 8 \leq (5+16+3+8)n^3$$

$$5n^3 \leq f(n) \leq 32n^3$$

$$\boxed{c_1 = 5, c_2 = 32, n_0 = 1}$$

$$f(n) \leftrightarrow \Theta(n^3)$$

2. what Should be the time Complexity :

for ($i=1$ to n) $\{j = i * 2\}$

$j = 2, 4, 8, 16, \dots$ K^{th} term --- n

$$G_n = \alpha n^{k-1}$$

$$G_n = 1(2)^{k-1}$$

$$n = 2^{k-1}$$

$$\log_2 n = (k-1) \log_2 2$$

$$\boxed{k = \log_2 n + 1}$$

$$\Theta(n) = \log n$$

3. $T(n) = \begin{cases} 3T(n-1) & \text{if } n > 0, \\ \text{otherwise } \pm \end{cases}$

$$T(n) = 3T(n-1)$$

$\curvearrowleft T(n-1) = 3T(n-2)$

$$T(n) = 3 \times 3T(n-2)$$

$\curvearrowleft T(n-2) = 3T(n-3)$

$$T(n) = 3 \times 3 \times 3T(n-3)$$

$$T(n) = 3^3 T(n-3)$$

$\curvearrowleft T(n-3) = 3T(n-4)$

$$T(n) = 2^2 (2T(n-3) + 1) + 2 + 1$$

$$T(n) = 2^3 T(n-3) + 2^2 + 2 + 1$$

$\nwarrow T(n-3) = 2T(n-4) + 1$

$$T(n) = 2^3 (2T(n-4) + 1) + 2^2 + 2 + 1$$

$n = i$

$$T(n) = 2^n T(0) + (1 + 2 + 2^2 + 2^3 + \dots + 2^{n-1})$$

$[T(0) = 1]$

$$T(n) = 2^n (1) + (1 + 2 + 2^2 + \dots + 2^{n-1})$$

$$T(n) = 2^n - 1 \quad \underline{(2^{n-1} - 1)} \quad 2 - 1$$

$$T(n) = 2^n - 2^{n-1} + 1$$

$$T(n) = 2^{n-1} (2-1) + 1$$

$$T(n) = 2^{n-1} + 1$$

Assume that $k \geq 1$ and $a > 1$ are constants.

Find out the value of c and n₀.

for what relation holds.

If $c > 1$ then the exponential

c^n for outgrows any term,

so that answer is:

n^k is $O(c^n)$.

12. Write the recurrence relation for recursive function that prints Fibonacci Series. Solve recurrence relation to get T.C. of programme. What will be the Space Complexity of this programme and why?

$$T(n) = T(n-1) + T(n-2) + c$$

$$T(n-2) \approx T(n-1)$$

$$T(n) = 2T(n-1) + c$$

$$\curvearrowleft T(n-1) = 2T(n-2) + c$$

$$\curvearrowleft T(n-2) = 2T(n-3) + c$$
